Dear Hiring Team,

Your Platform for Orchestration of Quantitative Model Execution is exactly the kind of system I want to help build next. The combination of a technically demanding distributed platform and a team that puts AI-assisted development at the centre of its engineering practice is rare, and it is the reason I am applying for the Senior Full Stack Developer role.

I bring around ten years of hands-on experience as a software engineer and architect, primarily in .NET and TypeScript. As Software Architect at Digitec Galaxus, I am rebuilding the warehouse logistics backbone of Switzerland's largest online retailer, a system that serves millions of customers and orders. We are tearing down years of legacy and replacing it with a resilient, scalable architecture grounded in Domain-Driven Design and modern distributed system patterns. I lead cross-team initiatives across some of the most complex business domains in the company, and I introduced AI-assisted development into our engineering culture, with Claude Code, GitHub Copilot, and MCP servers now part of the daily toolkit across the teams.

Before Digitec I built an energy data platform for international trading at Axpo, and developed features for the Swiss Life insurance portal including a large data migration to SAP C4C. At Zühlke I spent over two years on a private banking platform for high-net-worth clients, which gave me a solid understanding of the quality and regulatory demands of the wealth management domain.

LGT combines a stable, long-term environment with a modern platform that takes AI and engineering quality seriously, and I would like to bring my experience in distributed systems and AI-assisted development into a domain where rigor really matters. I would welcome the opportunity to discuss the role in an interview and look forward to hearing from you.

Kind regards,

Roman Weis
